Xyce™ XDM Netlist Translator User Guide, Version 2.4

Gary J. Templet, Garrick Ng, Richard L. Schiek, Peter E. Sholander, Jason C. Verley
ABSTRACT
This manual describes the installation and use of the Xyce™ XDM Netlist Translator. XDM simplifies the translation of netlists generated by commercial circuit simulator tools into Xyce-compatible netlists. XDM currently supports translation from PSpice, HSPICE, and Spectre netlists into Xyce™ netlists.
ACKNOWLEDGMENTS

We would like to acknowledge all the code and test suite developers who have contributed to the Xyce project over the years: Aaron Gibson, Alan Lundin, Antonio Gonzales, Ashley Meek, Bart van Bloemen Waanders, Brad Bond, Brian Fett, Christina Warrender, David Baur, David Day, David Shirley, Deborah Fixel, Derek Barnes, Eric Rankin, Erik Zeek, Gary Hennigan, Herman "Buddy" Watts, Jim Emery, Jonathan Woodbridge, Jonathen Kwok, Keith Santarelli, Laura Boucheron, Lawrence Musson, Lon Waters, Mary Meinelt, Michael Skoufis, Mingyu "Genie" Hsieh, Nicholas Johnson, Philip Campbell, Rachel Campbell, Randall Lober, Rebecca Arnold, Regina Schells, Richard Drake, Robert Hoekstra, Roger Pawlowski, Russell Hooper, Samuel Browne, Scott Hutchinson, Simon Zou, Smitha Sam, Steven Verzi, Tamara Kolda, Timur Takhtaganov, and Todd Coffey.

Also, thanks to Hue Lai for the original typesetting of this document in \LaTeX.

1. INTRODUCTION

The Xyce XDM Netlist Translator is a software solution developed by Sandia National Laboratories for translating SPICE netlists into a format readable by Xyce, Sandia’s internally developed SPICE-compatible simulation tool.

XDM (Xyce Data Model) can translate netlists written in PSpice, HSPICE, and Spectre formats. XDM’s PSpice translation capabilities are the most mature and can be considered production quality. Similarly, XDM’s HSPICE translation capabilities, introduced in the 2.0 release, are approaching production quality. Xyce has the command line option `-hspice-ext` to handle some cases where XDM doesn’t translate HSPICE syntax. PSpice and Spectre translations require no additional Xyce command line options. Spectre translations are new in version 2.4 and improving with each new release. For all netlist languages XDM supports, and for XDM itself, feedback from users is always appreciated. XDM users can send feedback, bug reports, and feature requests to, in order of preference:

- Xyce’s Google Group: [https://groups.google.com/g/xyce-users/](https://groups.google.com/g/xyce-users/)
- XDM’s Github Issue board: [https://github.com/Xyce/XDM](https://github.com/Xyce/XDM)
- Xyce’s Contact Page: [https://xyce.sandia.gov/contact_us.html](https://xyce.sandia.gov/contact_us.html)
- Xyce Email: xyce@sandia.gov

Sandia supplies binaries for RHEL7, OS X, and Windows that have the Boost and Python3 dependencies built in. The XDM executable is named “xdm_bdl”, short for “xdm_bundle”, and was chosen over “xdm” to avoid name clashes with the X11 “xdm” tool. “xdm_bdl” is a standalone C++ and Python program. New XDM releases are delivered as part of each new Xyce release.

XDM can be built on a number of platforms including Linux, OS X, and Windows. Building XDM requires the Boost Python libraries built with Python 3 and “PyInstaller”. Build instructions for XDM are included in the “README.md” file found in the XDM source available at [https://github.com/Xyce/XDM](https://github.com/Xyce/XDM).
2. XDM INSTALLATION

The installation procedure for the XDM binaries is substantially the same on Windows, Linux, and OS X (Darwin) systems with changes for system-dependent commands. For each of these operating systems XDM is delivered in binary form as a “zip” file:

- xdm-2.4.0-win64.zip
- xdm-2.4.0-Linux.zip
- xdm-2.4.0-Darwin.zip.

To install XDM unzip the file for the target system and then copy or move the directory it contains to the desired installation location. It is recommended to install XDM in the same location as Xyce. This helps users find XDM when running Xyce, and serves as a place to store different release versions of XDM, though the latest XDM release is always recommended. Finally, the XDM executable xdm_bdl is a standalone executable invoked from the command line. The path to xdm_bdl can be added to the “PATH” environment variable to avoid entering the full path each time xdm_bdl is invoked.

2.1. Windows

The Windows installation steps are:

- Open xdm-2.4.0-win64.zip with a double click
- Copy the unzipped folder xdm-2.4.0-win64 to the location of your choice. The directory in which Xyce was installed is a good choice. By default the Xyce package is installed in the C:\Program Files\ folder.
- Inside the xdm-2.4.0-win64\bin folder, a batch file, called xdm_console, is provided to automatically open a command window that has the XDM binary xdm_bdl in the path. This enables “xdm_bdl” to work without typing its full path for each invocation.
- For convenience, users can create a link to the xdm_console file on the desktop by right clicking on the file and selecting “Create shortcut.”

2.2. Linux and OS X

The Linux and OS X installation steps are:

- Open/Unzip the xdm-2.4.0-Linux.zip or xdm-2.4.0-Darwin.zip using the “unzip” or “tar” utilities found on Unix-like systems.
- Copy the unzipped folder xdm-2.4.0-Linux or xdm-2.4.0-Darwin to the location of your choice. The Xyce installation location is a good choice. By default this is /usr/local on Unix-like systems.
• Unlike Windows environments there is no batch file to open a shell window with the xdm_bdl automatically loaded into PATH variable. Instead users can edit their PATH environment variable is a couple ways:
  
  – Manually with command below for the current “Bash” and “Z Shell” windows.
    
    ```bash
    export PATH=$PATH:/usr/local/xdm-2.4.0-Linux/bin
    export PATH=$PATH:/usr/local/xdm-2.4.0-Darwin/bin
    ```

  – Automatically on shell startup by adding the appropriate command above for `.bashrc` or `.zshrc`. 
3. TRANSLATING NETLISTS WITH XDM

3.1. Startup

3.1.1. Windows

If you created a link to the xdm_console batch file (as described in Chapter 2), then double-click the file. Otherwise, start the “Command Prompt”. The remaining instructions assume the XDM binary is in your path.

3.1.2. Linux/OS X

Start a terminal shell. It is assumed that you have the XDM binary in your path.

3.2. Running XDM

An example XDM invocation for translating a file is

```
xdm_bdl -s hspice -d out -o xyce --auto test_circuit.sp
```

where

- `-s hspice` designates an HSPICE input format
- `-d out` designates writing output to a directory called, “out”
- `-o xyce` designates the Xyce output format
- `--auto` specifies that XDM should automatically translate any .INC/.LIB files
- `test_circuit.sp` is the input circuit to be translated

To see a full description of XDM’s flags, type `xdm_bdl -h` on the command line:

```
$ xdm_bdl -h
usage: xdm_bdl [-h] [-s [{hspice,tspice,pspice,spectre,xyce}]] [-d {DIR_OUT}]
            [-o {xyce}] [--auto] [--eval] [-l {DEBUG,INFO,WARN,ERROR}]
            [-q {R,C,D,L,X,Q,ALL}] [--license]
            input_file
```

xdm 2.0.0: Translates input netlist file by creating a new netlist file of a different netlist file format. The translated input file (of the same name) is written into the specified output directory - if you used the same directory as the input netlist file, the original file will be overwritten. xdm also
supports a device query interface for the SAW environment.

**Positional Arguments:**
- `input_file` The input netlist file

**Optional Arguments:**
- `-h, --help` Show this help message and exit
- `-s [{hspice, tspice, pspice, spectre, xyce}], --source_file_format [{hspice, tspice, pspice, spectre, xyce}]`
  The source/input netlist file format (default: pspice)
- `-d [DIR_OUT], --dir_out [DIR_OUT]`
  The output directory (default: default_dir)
- `-o [{xyce}], --output_file_format [{xyce}]`
  The output netlist file format (default: xyce)
- `--auto` Automatically translate include and library files (default: False)
- `--eval` Evaluate functions during translation (default: False)
- `-l {DEBUG, INFO, WARN, ERROR}, --logging {DEBUG, INFO, WARN, ERROR}`
  Control the level of screen logging output: WARN is quiet - only ERROR and WARN level messages will be sent to the screen (default: WARN)
- `-q {R, C, D, L, X, Q, ALL}, --query_device {R, C, D, L, X, Q, ALL}`
  Query for a device type of interest within the SAW environment (default: None)
- `--license` Display the license for this version of XDM (default: None)

Note that, while several input netlist formats are listed, only HSPICE, PSpice, and Spectre have functional support.

After XDM runs, the translated circuit file and its associated library files in the above example should be in the “out” directory. To run the circuit file in Xyce, the command:

```
Xyce test_circuit.sp -hspice-ext all
```

should be used to resolve any remaining translation issues not handled by XDM.

When XDM encounters something it doesn’t understand, it will either produce a warning message, and continue processing, or print an error message and stop processing. Typically, a warning message is produced when a specific line cannot be translated. In these cases, the user can choose to ignore the issue, or may be able to find an equivalent Xyce syntax by hand. An example warning message is shown in Figure 3-1. The line, in the input file, that caused the warning message is then typically left as a comment line in the translated netlist.

Error messages occur in cases where XDM cannot continue processing, such as a missing file, or non-ASCII characters appearing in the netlist. XDM will give as much information as possible for the source of the error. An example warning message is shown in Figure 3-2.
Figure 3-1. Example of an XDM Warning message.

```

```
4. PSPICE TRANSLATIONS: OVERVIEW AND KNOWN ISSUES

Libraries and Models  XDM does not throw a fatal error or emit a warning if a .MODEL statement is missing for a model that requires one. As a result, Xyce will emit an error message during netlist parsing.

Unsupported Device Groups  XDM does not yet support the following groups of devices, because of differences in syntax and parameters:

- Digital device models
- T devices (lossy/lossless transmission lines)

Unsupported PSpice Syntax  Some PSpice options and commands do not have a legal Xyce translation. The following are always commented out by XDM, but should not affect the Xyce simulation:

- .AUTOCONVERGE
- .OPTIONS ADVCONV
- .OPTIONS CHGTOL
- .OPTIONS ITL2
- .OPTIONS VNTOL

Undocumented PSpice Syntax  Some PSpice syntax is undocumented in the PSpice guides. The following are known examples (for device instance lines and .MODEL statements) that aren’t supported by XDM:

- Missing commas in TC specifications
  
  TC=0.1 0.1
  vs.
  TC=0.1,0.1
  
  – The latter is what is documented. The former will be commented out by XDM.

- Missing parameter values
  
  TC= or BV= without a value

- Extra matched set of parentheses
  
  .MODEL D1N3940 D((BV=600 DEV=1) IS=4E-10 RS=.105 N=1.48 CJO=1.95E-11)

- Unmatched right/left parentheses in .MODEL statements
  
  .MODEL D1N3940 D((BV=600 DEV=1%) IS=4E-10 RS=.105 N=1.48 CJO=1.95E-11)
**Piecewise Linear (PWL) Sources**  
XDM is able to handle these PSpice forms of PWL:

- Documented syntax in the PSpice Reference Guide
  
  \[
  V_{V1} 1 0 \text{ PWL } (1e-3, 0.5)(2e-3, 1)(3e-3, 1)(4e-3, 0.5)
  \]

- Undocumented syntax in the PSpice Reference Guide
  
  \[
  V_{V1} 1 0 \text{ PWL } 1e-3 0.5 2e-3 1 3e-3 1 4e-3 0.5
  V_{V2} 2 0 \text{ PWL } (1e-3, 0.5, 2e-3, 1, 3e-3, 1, 4e-3, 0.5)
  V_{V3} 3 0 \text{ PWL } (1e-3 0.5 2e-3 1 3e-3 1 4e-3 0.5)
  \]

- Using a file
  
  \[
  V_{FILE}1 5 0 \text{ PWL FILE } "pwlFile1.txt"
  \]

The following PSpice forms of PWL will be commented out by XDM, since they don’t have a legal (or straightforward) translation in Xyce:

- Some instances of **REPEAT**
  
  See Section 6.1.12, "Piecewise Linear Sources" of the Xyce Reference Guide for more details on how to manually translate these PSpice PWL instance lines.

- Anything using **TIME_SCALE_FACTOR** or **VALUE_SCALE_FACTOR**

**Controlled sources**  
While the documented syntax of the POLY form works for the F and G sources, the subcircuit syntax produced by OrCAD capture is not always consistent with the documentation.

**.PROBE and .PROBE64**  
Some of the wildcard forms used by .PROBE and .PROBE64 are not supported:

- `/V( )` all voltages
- `−/V( )` no voltages
- `−/V(X)` all voltages except internal sub-circuit voltages
5. HSPICE TRANSLATIONS: OVERVIEW AND KNOWN ISSUES

HSPICE .OPTIONS  With one exception, HSPICE .OPTIONS lines will be commented out in the translated Xyce netlist for the following reasons:

- There may not be a direct translation of HSPICE options into Xyce options.
- Even options with the same or similar names in HSPICE and Xyce may not have the same functionality.
- The exception is the TNOM option in HSPICE, which will be translated in the Xyce netlist.

Instance parameters  Issues to keep in mind with regards to translations of instance parameters:

- Instance parameters of devices that exist in HSPICE but not in Xyce will be automatically removed. E.g., DTEMP will be removed for for R, L and C devices. Watch for this in the on-screen warnings.
- Care needs to be used when deciding whether to translate with the -auto option. If a device is an instantiation of a model declared in another file, and auto translate is turned off, that device’s instance parameters will default to parameters using a default level (typically level=1). If the different model levels have different allowed instance parameters, this may result in parameters being removed.

Wildcards  Wildcards in .PRINT statements are generally illegal in Xyce, and will be commented out of the resulting netlist by XDM. The only exception is V(*), which is allowed and will be translated by XDM.

Multiplicity (M Factor)  In HSPICE, the “multiplicity” (or “M Factor”) can be used to specify multiple netlist devices in parallel via a single instance line. In Xyce, the terms “multiplicity factor” and “multiplier” are used to describe that same concept.

At present, the multiplicity factor (M parameter) is only supported in Xyce by the R, L, C and MOSFET device models, and some BJT device models (VBIC 1.3 and MEXTRAM). It is not supported for the X device (subcircuits).

AGAUSS and AUNIF  The AGAUSS and GAUSS functions are defined both in HSPICE and Xyce to handle Gaussian distributions. For uniform distributions, HSPICE then uses the AUNIF and UNIF functions, while Xyce uses the RAND function. The Xyce definitions are given in the “Expressions” section of the Xyce Reference Guide [1]. The HSPICE and Xyce versions of AGAUSS, GAUSS, AUNIF, UNIF RAND functions, are not yet fully compatible. See the Xyce Reference Guide for more details.
5.1. Commands known not to translate

The following command lines, found in HSPICE, are not directly supported in Xyce:

- .ALTER
- .TEMP
- .IF, .ELSEIF, ELSE and .ENDIF

In addition, any usages of DTEMP for subcircuits will likely need to be replaced with explicit parameter values, especially for DTEMP not equal to 0.

.NODESET The Xyce .NODESET command uses a different strategy than either SPICE3F5 or HSPICE. So, the Xyce behavior may differ from that provided by .NODESET and .OPTION DCHOLD in HSPICE. In addition, Xyce does not allow the use of “wildcards” in .NODESET (or .IC) statements. The “.NODESET (Approximate Initial Condition, Bias point)” section of the Xyce Reference Guide [1] gives more details on the Xyce implementation.

.OPTION MACMOD The various HSPICE MACMOD options allow HSPICE to search for subcircuit definitions or Verilog-A definitions in place of model references and/or vice-versa (depending on the specification). Xyce does not support this option at this time.

Verilog-A Support Xyce does have the capability to dynamically link in Verilog-A models. However, that capability is limited and not HSPICE compatible. In particular, it is not possible to insert Verilog-A models into Xyce via the netlist alone. So, Xyce does not support the HSPICE .HDL command.

Multiple .END Statements The following netlist is legal in HSPICE.

```
Multiple .END statements
******************************************************************************
V1 1 0 SIN(0 1 1e3)
R1 1 2 1
R2 2 0 2
.TRAN 10u 1m
.PRINT TRAN V(1) V(2)
.END

V1 1 0 SIN(0 1 1e3)
R1 1 2 1
R2 2 0 3
.TRAN 10u 1m
.PRINT TRAN V(1) V(2)
.END
```
Both simulations will be run, once with the resistance of R2 equal to 2 and once with its resistance equal to 3. In Xyce, the simulation would only be run with the resistance of R2 equal to 2. All of the text after the first .END statement would be treated as comment lines by the Xyce parser. To run both simulations in Xyce, the appropriate .STEP or .DATA statement would be used to set the desired values for the resistance of R2.

5.2. Xyce -hspice-ext Command Line Option

The Xyce command line option, -hspice-ext, is almost always required when running a netlist translated by XDM. It allows the Xyce parser to accept a limited set of HSPICE syntax features, in lieu of the Xyce ones, for the limited set of cases shown in Table 5-1. These features are particularly difficult for XDM to translate, but are easy for Xyce to handle if it knows about them.

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Functionality</th>
</tr>
</thead>
<tbody>
<tr>
<td>-hspice-ext units</td>
<td>Toggles on A=1e-18 as a scaling factor</td>
</tr>
<tr>
<td>-hspice-ext math</td>
<td>Toggles in the HSPICE meanings for the logical operators</td>
</tr>
<tr>
<td>-hspice-ext random</td>
<td>AGAUSS() and GAUSS() will return the mean value rather than a random variate</td>
</tr>
<tr>
<td>-hspice-ext all</td>
<td>Does all three</td>
</tr>
<tr>
<td>-hspice-ext units,math,random</td>
<td>A comma-separated listing is also legal. This example is equivalent to all.</td>
</tr>
</tbody>
</table>
6. SPECTRE TRANSLATIONS: OVERVIEW AND KNOWN ISSUES

This is a list of common known issues the user may encounter when translating from Spectre. It is by no means an exhaustive list.

**Spectre options** All Spectre options lines will be commented out in the translated Xyce netlist for similar reasons as .OPTIONS in HSPICE (see preceding chapter "HSPICE Translations: Overview and Known Issues").

**Analysis statements** The only analysis statements XDM will currently translate are dc, ac, and tran. In addition, translations of secondary sweeps are not currently supported.

**Instance parameters** Guidelines similar to those listed for translations of HSPICE instance parameters (see preceding chapter "HSPICE Translations: Overview and Known Issues") should be kept in mind for translations of Spectre instance parameters as well.

**Subcircuit parameters** Spectre does not make a clear distinction between instance parameters of a subckt statement and parameters within that block. Because of this, the XDM translation puts all parameters inside the subcircuit block.

**Spectre simulator command** Spectre allows switching to a SPICE input reading mode through the use of the simulator lang=spice command. XDM can process this statement and will automatically switch to the HSPICE parser for translation in this case, although only one such language switch is allowed per file.

**Multiplicity (M Factor)** Similar issues surrounding multiplicity factor delineated in the previous chapter (see "HSPICE Translations: Overview and Known Issues") exists in Spectre translations as well.

**Distribution functions and the statistics block** Translations of functions that create random distributions in Spectre, such as gauss and unif, and the statistics blocks they reside in are not currently supported. They will be commented out in the translated files.
6.1. **Commands known not to translate**

The following commonly found statements in Spectre are not directly supported in Xyce:

- alter and altergroup
- checkpoint
- if

**Verilog-A Support**  As mentioned in the previous chapter, Xyce does not generally support Verilog-A models. Therefore, XDM will comment out Spectre .ahdl__include statements.
7. TRANSLATION OF PDK MODEL LIBRARIES

The entirety of an HSPICE- or Spectre-based PDK model library can be converted by translating a circuit that includes the model library through the .INC or the .LIB file in HSPICE and the include file in Spectre, and using the --auto option.

To translate the PDK without an accompanying circuit, create a dummy file that has just single include statement for the top level wrapper file; for example in HSPICE:

```plaintext
.INC design.inc
```

or

```plaintext
.LIB design_wrapper.lib TT
```

and translate that with the --auto option.

It is recommended to translate a PDK’s model library all at once with the circuit netlist using the --auto option, since XDM does some cross-checking of models and may remove parameters and/or comment out lines if all the information in a PDK isn’t processed at the same time (see Chapter 5 for more details).

In past releases of Xyce, there were instances where it may have been necessary to pre-evaluate certain functions in the model library using XDM in order for a circuit to run in Xyce. If a Xyce simulation of a circuit hung and did not run to completion, users could try to translate the circuit with the pre-evaluation flag on. This is done using the --eval option in addition to the --auto option at the command line. As of release 7.2 of Xyce, this should no longer be necessary. However, the function pre-evaluation mode in XDM remains in available at this time.

- In this mode, XDM will evaluate functions in the model library based on the .PARAM statements and device instance parameters listed in the circuit, and will write the values of those evaluations into the circuit and model library files.

- The resulting translated model library will be specific to the circuit, and cannot be used in general with other circuits designed with the same model library. Users will have to re-run the translation again on different circuits to get the translated model library specific to that circuit.

- The function evaluation and pre-processing may take up to several minutes to complete, especially if the circuit includes functions that involve a high degree of nesting.
8. **RELEASE NOTES**

8.1. **XDM 2.4**

8.1.1. **General**

- Substitutions done by XDM for the special variable TEMP are no longer necessary and are taken out in this release.

8.1.2. **HSPICE**

- Xyce’s “-hspice-ext” option, which should be used when running HSPICE netlists translated by XDM, now by default expects the “.” for the subcircuit hierarchy separator character. Therefore, XDM translations will leave that character unchanged rather than translating it to Xyce’s native “:” subcircuit separator character.
- Secondary sweep of .DC analyses should now be translated correctly into Xyce.
- Xyce can now handle resistors with solution dependent expressions for their resistance values. Therefore, XDM will no longer translate solution dependent resistors into behavioral B-element sources.

XDM uses the Python 2.7 Standard Library:

Python is Copyright 2001-2020 Python Software Foundation; All Rights Reserved

1. This LICENSE AGREEMENT is between the Python Software Foundation ("PSF"), and the Individual or Organization ("Licensee") accessing and otherwise using Python 2.7.17 software in source or binary form and its associated documentation.

2. Subject to the terms and conditions of this License Agreement, PSF hereby grants Licensee a nonexclusive, royalty-free, world-wide license to reproduce, analyze, test, perform and/or display publicly, prepare derivative works, distribute, and otherwise use Python 2.7.17 alone or in any derivative version, provided, however, that PSF’s License Agreement and PSF’s notice of copyright, i.e., "Copyright © 2001-2020 Python Software Foundation; All Rights Reserved" are retained in Python 2.7.17 alone or in any derivative version prepared by Licensee.
3. In the event Licensee prepares a derivative work that is based on or incorporates Python 2.7.17 or any part thereof, and wants to make the derivative work available to others as provided herein, then Licensee hereby agrees to include in any such work a brief summary of the changes made to Python 2.7.17.

4. PSF is making Python 2.7.17 available to Licensee on an "AS IS" basis. PSF MAKES NO REPRESENTATIONS OR WARRANTIES, EXPRESS OR IMPLIED. BY WAY OF EXAMPLE, BUT NOT LIMITATION, PSF MAKES NO AND DISCLAIMS ANY REPRESENTATION OR WARRANTY OF MERCHANTABILITY OR FITNESS FOR ANY PARTICULAR PURPOSE OR THAT THE USE OF PYTHON 2.7.17 WILL NOT INFRINGE ANY THIRD PARTY RIGHTS.

5. PSF SHALL NOT BE LIABLE TO LICENSEE OR ANY OTHER USERS OF PYTHON 2.7.17 FOR ANY INCIDENTAL, SPECIAL, OR CONSEQUENTIAL DAMAGES OR LOSS AS A RESULT OF MODIFYING, DISTRIBUTING, OR OTHERWISE USING PYTHON 2.7.17, OR ANY DERIVATIVE THEREOF, EVEN IF ADVISED OF THE POSSIBILITY THEREOF.

6. This License Agreement will automatically terminate upon a material breach of its terms and conditions.

7. Nothing in this License Agreement shall be deemed to create any relationship of agency, partnership, or joint venture between PSF and Licensee. This License Agreement does not grant permission to use PSF trademarks or trade name in a trademark sense to endorse or promote products or services of Licensee, or any third party.

8. By copying, installing or otherwise using Python 2.7.17, Licensee agrees to be bound by the terms and conditions of this License Agreement.
